

Figure 1 is a line graph showing the number of bitstrings K required to reach a target error rate for four different algorithms: BARK, Simplified BARK, Ceiling, and SKQD. The x-axis represents the 'Number of bitstrings K / Hilbert space dimension' on a logarithmic scale, ranging from 10^{-2} to 10^0 . The y-axis represents the 'Number of bitstrings K ' on a logarithmic scale, ranging from 10^1 to 10^4 . The SKQD algorithm (orange solid line) maintains a constant high value of K across the entire range. The BARK (blue line with circles) and Simplified BARK (green line with triangles) algorithms show a sharp decrease in K as the dimension increases, reaching a plateau around 10^1 for K values greater than 10^{-1} . The Ceiling algorithm (black dotted line) shows a more gradual decrease in K , reaching the same plateau around 10^{-1} . Shaded regions around the lines indicate confidence intervals.

runs per point -- BARK: 164, Ceiling: 164, SKQD: 164, Simplified BARK: 164
